

Assignment A1 21403

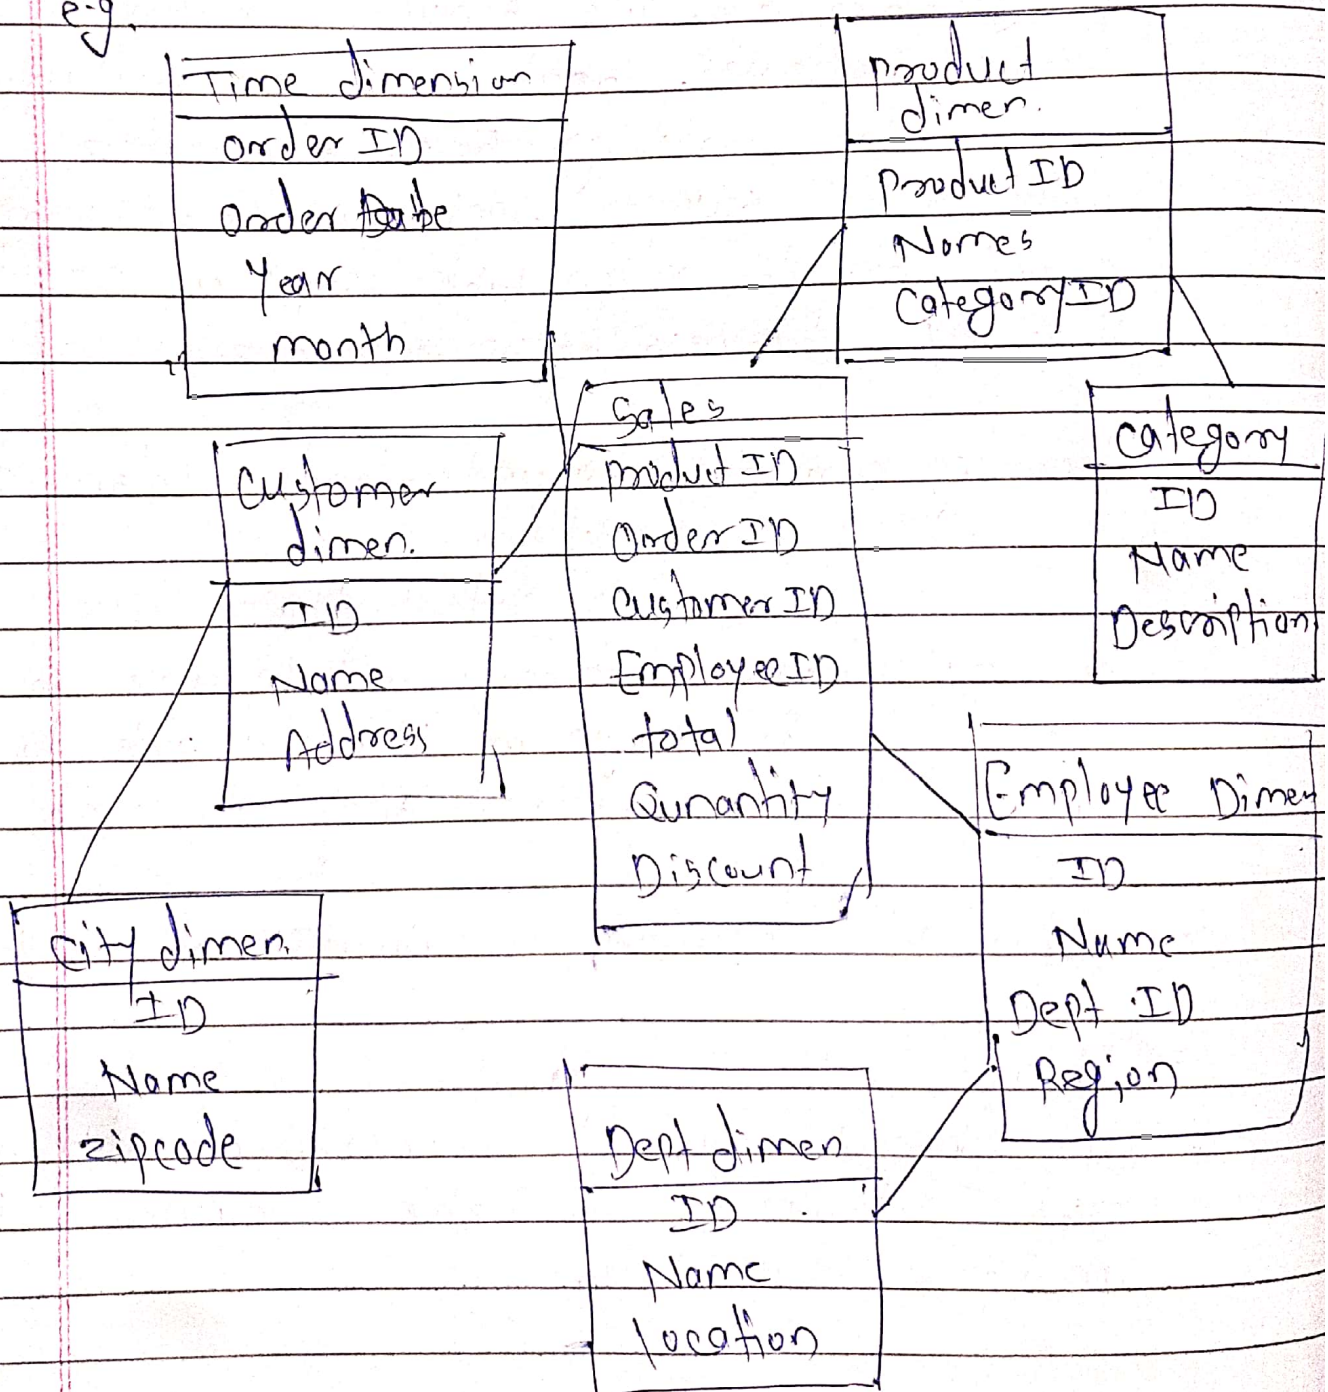

- Title: Design star/snowflake schemas for analyzing the process
- problem statement: for an organization of your choice, choose a set of business processes. Design star/snowflake schemas for analyzing these processes. Create a fact constellation schema by connecting them. extract data from different data sources apply suitable transformation & load into destination tables using an ETL tool, for e.g. business organizations: sales order.
- learning objective: To understand star/snowflake schema
To understand ETL tools
- Learning Outcomes: Students will be able to use ETL tool to design and also be able to analyze different schemas (snow, star, etc)
- slw H/w requirements: An ETL tool e.g. Pentaho
- Theory:
 - snowflake schema: It is variant of star schema. The centralized fact table is connected to multiple dimensions.

41403

In the snowflake schema, dimensions are present in normalized form in multiple related tables. This effect affects only the dimension tables and not the fact tables.

e.g.

41403

Dimension are maintained in normalized form to reduce dependency. Tables are easy to maintain & save storage space

- Characteristics

- use small disk space
- easy to implement
- performance reduces due to multiple tables

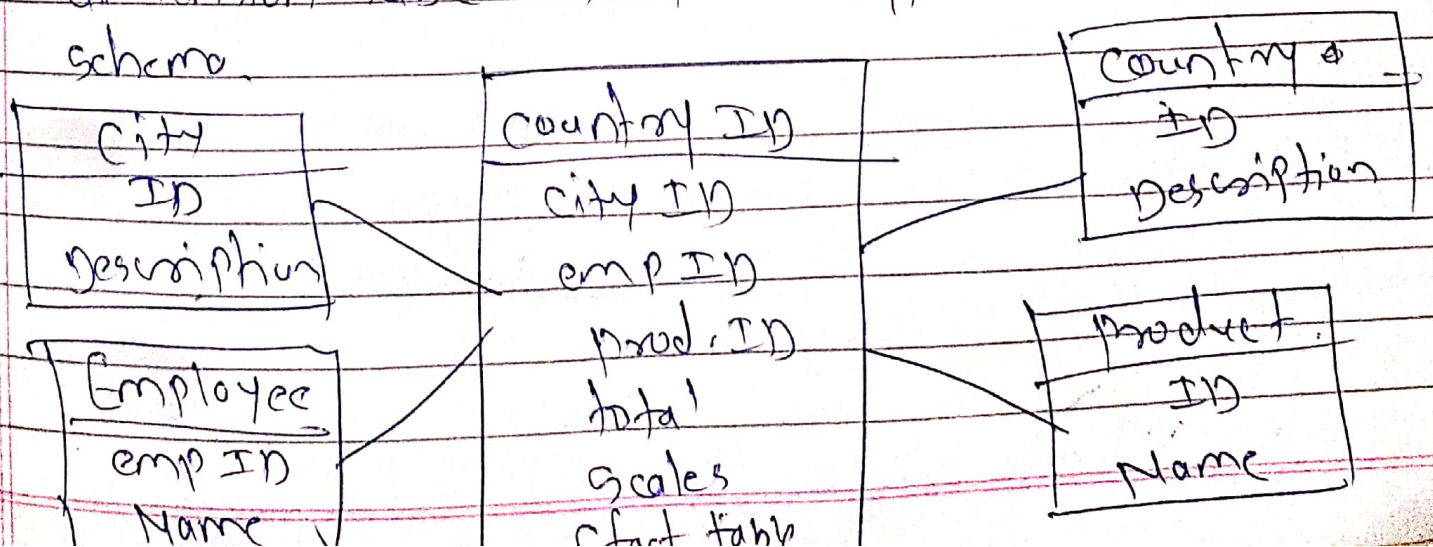

- Advantages

- provides structured data which reduces the problem of data integrity
- highly structured data reduces disk space

- Disadvantages

Hierarchy should belong to the dimension table only & should never be snowflaked

- Star schema: can have one fact table and many dimension table. Simplest type of data warehouse schema.

- characteristics:

- only one fact table
- Dimension table or not joined to each other
- easy to understand

- selected organization: college snowflake schema

| City dimen. | |
|-------------|--|
| ID | |
| Name | |
| Zipcode | |

| Employee dimen | |
|----------------|--|
| ID | |
| Name | |
| Dept ID | |

| Fact table | |
|------------|--|
| Emp. ID | |
| Product ID | |
| Store ID | |
| Sales ID | |
| price | |
| Quantity | |

| Store Dimen | |
|-------------|--|
| ID | |
| city ID | |

| Dept. Dimen | |
|-------------|--|
| ID | |
| Name | |
| location | |

| Product dimen | |
|---------------|--|
| ID | |
| Name | |
| Type | |
| Description | |

- ETL tools:

- ETL stands for extract transformation tool
- Extract means extracting the data from heterogeneous or homogeneous sources into our environment for integration & generate insight from it.
- ETL tools extract data from different sources (tables, flat, files, etc) & process this data.
- Transformation phase data is cleaned according to need. Data can be trimmed, appended, filtered, joins to be generated, etc.
- In the load phase, final data is loaded into the target DB, or into flat files or in the form of web service.

- conclusion: Thus, I understood the different schema used (star, snowflake, etc) used Pentaho tool for performing translation
